1 Preface

Modern Yamaha¹ keyboards provide sophisticated accompaniment functions. They have built in "accompaniment styles" for a number of different musical genres. But many keyboards are not limited to these built in styles. They provide the capability to use additional styles loaded into the keyboard, or even to create new styles. Additional styles may be purchased, downloaded from the internet, created from various sources or created from scratch.

There is a lot of information available on the internet regarding these styles. But this information is widely spread and difficult to find, especially for beginners.

This document tries to summarize all this information to provide an easy entry point for beginners as well as a reference for advanced style creators or software programmers. The document focuses on the technical details of styles. It does not cover the musical aspects for creating styles (see chapter 7.3 for links to style creation info).

As said, most of the information is already available on the Internet, due to the hard work and generosity of a lot of people. Please refer to chapter 6 for details about the contributing people. The authors of this document explicitly want to avoid the impression that they may claim credit for other peoples work.

The authors of this document are not affiliated with Yamaha in any way, and Yamaha has not specifically approved the inclusion any of the information therein. The information presented has assembled from material posted by others on the internet, or discovered through private experimentation; no representation is made regarding its accuracy or completeness.

2 Introduction

This document is about styles for Yamaha keyboards. Keyboards from other manufacturers may have similar style functionality, but the details are very different. So everything in this document is only related to Yamaha keyboards. Some features of styles are not available on all keyboards, especially not on older models.

There are two categories of styles:

- Built in styles
- Loadable styles

Smaller/older keyboards may have only built in styles and do not support loadable styles. Modern keyboards often support both categories.

A loadable style is a file, exactly like used on Microsoft Windows² computers. How this style file is loaded into the keyboard depends on the keyboard model. It may be loaded using a standard floppy disk, an USB stick, a Smart Media card, a CD or a connection to a computer. This implies that the style file may easily be transferred to/from a computer.³

Style files can be modified by some keyboard models as well as with programs running on a computer. There are a lot of free programs available that allow creating and modifying styles in any manner. (See chapter 7.1 for more information.)

The main subjects of this document are the details about these style files.

¹ Yamaha is a trademark of Yamaha Corporation.

² Windows is a trademark of Microsoft Corporation.

³ Periodically users report problems trying to access, view, rename or save style files.

To eliminate these problems, in Windows Explorer/Tools/Folder Options/View Tab, confirm the following settings:

'Hide extensions for known file types' is unchecked

'Display the content of system folders' is checked

'Show hidden files and folders' is checked.

3 Styles – What they are and how they work in general

A style is a special form of a type 0 midi file followed by several information sections. To function, it must be loaded into the PSR. This process reads the file and establishes some of the instrument settings based upon commands in the midi and information sections. When the accompaniment is started (via synch start, the Start button or an external midi command) the portions of the midi section are played in response to the state of the front panel style control buttons.

Internally, a style starts by specifying the tempo, the time signature and the copyright followed by several sections that are defined by marker events. The first two, SFF1 and SInt, occupying the first measure of the midi section, include a Midi On plus midi commands to setup the default instruments and the amount of DSP (only DSP1 as a system effect is available for styles) used for each track. Each of the other markers (Intro A, Main B, etc) defines musical patterns that are triggered by the keying chords. Intros play only once when triggered and then turn control over to the next section selected by the panel buttons. Main sections (A, B, C, and D) repeat until the style is stopped or an Ending or an Intro is selected. Ending sections play once and the style is stopped. Fill Ins are triggered manually, or play automatically (if Auto Fill is On) when a new main section is selected.

Fill Ins are limited to one measure in length; other sections can be any length up to 255 measures, but are typically 2-8 measures.

4 Style File Format

This chapter describes how the various data is stored in style files. This includes the structures of the data, their sizes, their order, their coding, etc. This information is especially useful for programmers.

A description about the contents and detailed meaning of the data (i.e. everything that may be added or modified with one of the special style editors) is described in chapter 5. This information is useful for programmers as well as for all people trying to create or modify styles.

4.1 Conventions

Throughout the document numbers are written in different kinds, depending on what is appropriate in the context:

- Decimal Decimal numbers are written without any prefix or suffix, e.g. 256.
- Hexadecimal Hexadecimal numbers are written with the suffix "H", e.g. 1FH, 25H.
- Binary Binary numbers are written with the suffix "B", e.g. 00001110B

See the appendix A for a decimal-hexadecimal translation table.

4.2 General

Style files may have different file extensions. Currently the following are known:

- ".sty" Standard
- ".bcs" Basic
- ".prs" Professional
- ".sst" Session
- ".pcs" PianoCombo

- ".pst" Pianist

All these style file types have the same format, which is described in this chapter. Older keyboard may require that the style file has the extension ".sty". In this case, just renaming the style file to the extension ".sty" will often work.

Currently not much is known about the effect of these style file extensions except that the style file type is displayed together with the style name on some instruments.

4.3 General structure of a style file

A simple style file is just a standard midi file. This midi file has to be a midi type 0 file. It contains the musical sequences of the style as well as some control information. The midi data has to follow a number of rules. These rules are described in detail in chapter 4.5.

Modern style files are extended by adding special data sections at the end of this midi file.

An extended style file consists of one or more different sections of the following types:

- MIDI section (mandatory)
- CASM section (optional)
- OTS (One Touch Setting) section (optional)
- MDB (Music Finder) section (optional)
- MH section (optional) (very rarely used)

The midi section is the only mandatory section. It contains the musical sequences of the style. An optional CASM section contains extended information for the keyboard how to interpret and control playing of the style section. While its inclusion is optional, very likely the style's author used it to convey important information and the style will not reproduce properly if removed. The OTS (One Touch Setting) section contains information for the four settings selectable from the keyboard. These can be used to easily setup the keyboard before using the style. The MDB (Music Finder) section contains information for what songs this particular style is appropriate. This information is automatically added to the Music Finder function, if the keyboard supports it. In very rare cases there is a MH section at the end of the style file. Nothing is known about the purpose of this section. For details see the next chapters.

Only one section of each type may be present in a style file.

Note that older/smaller keyboard models may not support styles with OTS or MDB sections. There may also be a limit on the size of the style file that can be loaded into the keyboard. There are programs available that can be used in this case to remove unwanted sections or parts from the style file. For more details see chapter 7.1.

The common order of the sections in the file is at follows:

1. Midi section
2. CASM section
3. OTS (One Touch Setting) section
4. MDB (Music Finder) section
5. MH section

Other orders may also work, but for compatibility reasons it is recommended to use the above order.

Programs that work with style files should not depend on the order and existence of optional sections when reading style files. When writing style files, the programs should use the common order of the sections to avoid possible problems with the various keyboard models.

Note: Many programs designed to read and/or edit standard midi files (e.g. sequencers, editors, players) will remove the optional sections and the files generated by them will not

function properly in the instrument. This can be avoided by using programs that specifically designed to work with style files.

4.4 General structure of sections

The overall structure of a style file is:

Note: As the optional section 5 (MH section) is very rarely used, and especially not present in current style files, it is no more shown in the following diagrams.

The sections are structured in such a way that the beginning and end of a section can be found without having to know all the internal details of the concerning structure. This allows a program to find the beginning of a specific section without even to know anything about the other section types.

As said above, section 1 is always a standard midi file structure of a midi type 0 file. The general structure of this section is a little bit different than the structure of sections 2...4, which share the same common structure.

Structure of section 1 (midi section):

Common structure for sections 2...4:

Details of general structure for section 1 (midi section):

Style Files - Introduction and Details

Byte Index ⁴		Description
0..3	byte[0] = 'M' (4DH) byte[1] = 'T' (54H) byte[2] = 'h' (68H) byte[3] = 'd' (64H)	This 4-character sequence identifies this section as a midi file, which in a style consists of a midi header followed by a track header and track data. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of header data bytes following. The length of the midi header is always 6 bytes. This means, the first byte which is counted here of the track header is byte[14].
8..13	Data bytes	Midi header data.
14..17	byte[14] = 'M' (4DH) byte[15] = 'T' (54H) byte[16] = 'r' (72H) byte[17] = 'k' (6BH)	This 4-character sequence identifies the midi track. Note: The characters are case sensitive.
18..21	Nr of data bytes = 256*256*256*byte[18] + 256*256*byte[19] + 256*byte[20] + byte[21]	Number of bytes in the midi track. The first byte that is counted here is byte[22].
22..n	Midi data bytes (Number as given above)	Midi track data. More details are described in chapter 4.5.

Table 1

Details of common structure for section 2...4:

Byte Index		Description
0..3	byte[0] = 'X' byte[1] = 'X' byte[2] = 'X' byte[3] = 'X'	This 4-character sequence identifies the type of the section. (See the individual section chapters for more information.) Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte that is counted here is byte[8].
8..n	Data bytes (Number as given above)	Section dependent data. More details are described in chapter 4.5.2, 4.7 and 4.8.

Table 2

More details are described in the individual section chapters below.

⁴ The byte index always starts from the beginning of the section, structure or substructure which is currently discussed.

4.5 *Midi Data section*

4.5.1 General

The midi section is midi type 0, which means that there is one midi track.

4.5.2 Midi Command Format

4.5.2.1 General

The data following the Midi and Track headers are midi events. Unlike the header data, the fields are not organized in a fixed format, but are records of various lengths whose general format is:

Execution Time - Command Byte – Data

They are generally organized as follows.

Function	Description	Byte Length
Execution Time	Number of ticks since last event.	Variable length, <=4
Command ID	Identifies the type of the command 00H .. 7FH running mode, command id not present 80H .. EFH midi events FOH sysex FFH meta data	1
Data	3 types: midi events, sysex events, meta events	Varies by command type

Table 3

There is also an abbreviated command format, called running mode where the Command ID is omitted, i.e.: Time Data. In this case the last Command ID is used. This mode is identified by a value <128 in the Command ID location.

The use of variable length formatting and running mode was included in the specification to reduce the size (and hence transmission time) of midi files.

4.5.2.2 Details

4.5.2.2.1 Time

There are one to four time bytes that are at the beginning of each midi event. Time is measured in “delta time” which is defined as the number of ticks (the resolution of which is defined in the header) before the midi event is to be executed. I.e., a delta time of 0 = immediately; a delta time of 960 when the resolution is 1920 ticks per quarter note is after a 1/8 note rest. Delta time is a variable length format using 7 of the 8 available bits; the maximum time value of any time byte is 127 (7FH). The first or 8th bit is used to identify the last of the delta time bytes; the least significant byte is indicated by a leading bit =0, all other bytes have a leading bit=1.

Total delta time= 128^3 (byte4) + 128^2(byte3) + 128*(byte2) + byte1

Style Files - Introduction and Details

4.5.2.2.2 Midi Events (Command ID 127-239)

Midi event send commands to one of the 16 possible midi channels. The event command consists of a leading 4 bits that identifies the command and a trailing 4 bits that identifies the midi channel. In the table below, X=midi channel (0-15, 0H-FH). Available commands are:

Command ID (Hex)	Data	Description	Byte Length
8X	nn vv	Note On. nn=note number (0-127); vv= velocity (0-127)	3
9X	nn vv	Note Off; see above	3
AX	kk vv	Key Press	3
BX	cc uu	Control Change; cc=controller number*, uu = data value	3
CX	pp	Program Change; pp= program number (0-127)	2
EX	v1 v2	Pitch Wheel Change; v1= bottom value, v2=top value	3

* allowed values listed in "Meaning, Functionality and Requirements of Midi Data used in Styles" later in this document.

Table 4

4.5.2.2.3 Sysex Events

Sysex Events which are used to provide instrument control such a master pitch, DSP settings, etc. They do not specify a channel. The total event length is equal to the sum of the command ID byte, data length byte(s) in variable length format and the data length.

Byte	Function	Description
1	Command ID	always 240 (F7H)
1+	Length, not including ID and length byte(s)	Variable length format
Defined by length	Sysex Data	Last byte always 247 (F7H)

Table 5

4.5.2.2.4 Meta Events

Meta events convey general information such as copyright, lyrics, tempo, time & key signature. They do not specify a channel. The total event length is equal to the sum of the command ID byte, data length byte(s) in variable length format and the data length.

Command ID	Meta ID	Length	Data Description
255(FFH)	0(00H)	2	Sequence number
"	1(01H)	Length of text	Text data
"	2(02H)	Length of text	Copyright text
"	3(03H)	Length of text	Track name text
"	4(04H)	Length of text	Track Instrument name text
"	5(05H)	Length of text	Lyric text
"	6(06H)	Length of text	Marker text
"	7(07H)	Length of text	Cue point text
"	32(20H)	1	Midi Channel Prefix
"	33(21H)	1	Midi Port
"	47(2FH)	1	End of Track
"	81(51H)	3	Tempo in microseconds /quarternote
"	84(54H)	5	SMPTE Offset (hr + min + sec + frame + frame)
"	88(58H)	4	Time signature=numerator + denominator (2= quarter, 3= eighth) + Ticks in

Style Files - Introduction and Details

			metronome click + number of 32 nd notes to the quarter note
"	89(59H)	2	Key signature= sharps/flats (- value= number of flats, 0= key of C, + value = number of sharps) + major/minor(0/1)
"	127 (7FH)	Length of data	Yamaha sequencer specific info.

Table 6

4.6 CASM section

The information in the CASM section is necessary if the midi section does not follow the rules for "simple" style files, which do not necessarily need a CASM section (see chapter 5.2.1 for the rules). The CASM section gives instructions to the instrument on how to deal with the midi data.

This includes:

- Assigning the sixteen possible midi channels to 8 accompaniment channels which are available to a style in the instrument (9 = sub rhythm, 10 = rhythm, 11 = bass, 12 = chord 1, 13 = chord 2, 14 = pad, 15 = phrase 1, 16 = phrase 2). More than one midi channel may be assigned to an accompaniment channel.
- Allowing the PSR to edit the source channel in StyleCreator. This setting is overridden by the instrument if the style has > 1 midi source channel assigned to an accompaniment channel. In this case the source channels are not editable.
- Muting/enabling specific notes or chords to trigger the accompaniment. In practice, only chord choices are used.
- The key that is used in the midi channel. Styles often use different keys for the midi data. Styles without a CASM must be in the key of CMaj7.
- How the chords and notes are transposed as chords are changed and how notes held through chord changes are reproduced.
- The range of notes generated by the style.

See chapter 5.2 for a more detailed description of the usage of this data.

4.6.1 General

There is only one CASM section in a style file.

The CASM section allows defining separate instructions for each style part (e.g. Intro A, Main B) of each source midi channel.

First level of details about the structure of the CASM section:

Byte Index		Description
0..3	byte[0] = 'C' (43H) byte[1] = 'A' (41H) byte[2] = 'S' (53H) byte[3] = 'M' (4DH)	This 4-character sequence identifies this section as a CASM section. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte that is counted here is byte[8].
8..n	Data bytes (Number as given above)	CASM data. More details are described in chapter 4.6.2.

Table 7

4.6.2 CASM data

The CASM data consists of one or more CSEG structures.

A CSEG structure contains the data related to a style part in the midi section (e.g. Intro A, Main B). One CSEG structure may be associated to more than one style part, which means that these style parts share the same data. For current instruments there may be a maximum number of 16 CSEG structures (for 3 Intros, 3 Endings, 4 Variation Fill Ins, 4 Mains and 1 Break Fill In).

The number of CSEG structures depends on the number of style parts in the midi section and whether there are CSEG structures covering multiple style parts. The actual number of CSEG structures has to be derived from the size of the CASM data. This means, as long as the total size of found structures is less than the size of the CASM data, there will be additional CSEG structures.

Details about the CSEG structure:

Byte Index		Description
0..3	byte[0] = 'C' (43H) byte[1] = 'S' (53H) byte[2] = 'E' (45H) byte[3] = 'G' (47H)	This 4-character sequence identifies this section as a CSEG structure. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte that is counted here is byte[8].

8..n	Data bytes (Number as given above)	CSEG data. More details are described in chapter 4.6.3
------	---------------------------------------	---

Table 8

4.6.3 CSEG Data

The CSEG structure consists of one Sdec structure, one or more Ctab structures and one or more optional Cntt structures.

The number of Ctab and Cntt structures has to be derived from the size of the CSEG data. This means, as long as the total size of found structures is less than the size of the CSEG data there will be additional Ctab or Cntt structures. Alternatively, examining the data for repeated use of the IDs used in the CASM section (CSEG, Sdec, Ctab and Cntt) will also access any additional CASM data.

4.6.3.1 Sdec structure

There is one Sdec structure at the beginning of the CSEG data.

The Sdec structure defines for which style part or parts (e.g. Intro A, Main B) the following data in the Ctab and Cntt structures belongs to. If there is more than one style part listed, this means that these style parts share the same data.

Details about the Sdec structure:

Byte Index		Description
0..3	byte[0] = 'S' (53H) byte[1] = 'd' (64H) byte[2] = 'e' (65H) byte[3] = 'c' (63H)	This 4-character sequence identifies this structure as an Sdec structure. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte that is counted here is byte[8].
8..n	Data bytes (Number as given above) e.g.	Sdec data. Contains one or more names of style parts for

Style Files - Introduction and Details

byte[8] = 'M' byte[9] = 'a' byte[10] = 'i' byte[11] = 'n' byte[12] = ' ' byte[13] = 'A' byte[14] = ',' byte[15] = 'l' byte[16] = 'n' byte[17] = 't' byte[18] = 'r' byte[19] = 'o' byte[20] = ' ' byte[21] = 'B'	which this CSEG data has to be used. Multiple names are separated with commas. There is no comma after the last style part name string. The strings are case sensitive. Valid strings are: Intro A Intro B Intro C Intro D (only supported by PSR-2000) Main A Main B Main C Main D Fill In AA Fill In BB Fill In CC Fill In DD Fill In BA (for the "Break" section) Ending A Ending B Ending C Ending D (only supported by PSR-2000)
--	--

Table 9

4.6.3.2 Ctab structure

Immediately after the Sdec structure there are one or more Ctab structures. The number of Ctab structures depends upon the number of midi channels used in style parts covered by the SDEC section. There is one Ctab structure for each midi source channel used in the midi section for the related style sections.

The number of Ctab structures has to be derived from the size of the CSEG data.

Details about the Ctab structure:

Byte Index		Description
0..3	byte[0] = 'C' (53H) byte[1] = 't' (64H) byte[2] = 'a' (65H) byte[3] = 'b' (63H)	This 4-character sequence identifies this structure as a Ctab structure. Note: The characters are case sensitive.
4..7	Nr of data bytes = $256 * 256 * 256 * \text{byte}[4]$ $+ 256 * 256 * \text{byte}[5]$ $+ 256 * \text{byte}[6]$ $+ \text{byte}[7]$	Indicates the nr of data bytes following. This means, the first byte that is counted here is byte[m+8].
8..n	Data bytes (Number as given above)	Ctab data. More details are described in chapter 4.6.3.3.

Table 10

4.6.3.3 Ctab data

Byte Index		Description
0	Source channel	Midi source channel

Style Files - Introduction and Details

	Values 00H .. 0FH	<p>The values 00H .. 0FH represent the midi channels 1..16.</p> <p>For details about the meaning see chapter 5.2.2.</p>
1...8	<p>Name</p> <p>Character 1 = byte[1]</p> <p>:</p> <p>Character 8 = byte[8]</p>	<p>Name.</p> <p>The name can be any string up to 8 characters long. Unused characters at the end of the name are filled with spaces (20H). Does not contain any "end of string" termination (like '\0').</p>
9	<p>Destination channel</p> <p>Values 08H .. 0FH</p>	<p>The accompaniment midi channel to which the source channel should be mapped.</p> <p>The values 08H .. 0FH represent the midi channels 9..16.</p> <p>Valid destination channels are 9..16:</p> <ul style="list-style-type: none"> 9 = sub rhythm 10 = rhythm 11 = bass 12 = chord 1 13 = chord 2 14 = pad 15 = phrase 1 16 = phrase 2 <p>For details about the meaning see chapter 5.2.2.</p>
10	<p>Editable</p> <p>Values 00H or 01H</p>	<p>Defines if the data in the source channel is editable.</p> <p>00H = Channel data is editable</p> <p>01H = Channel data is NOT editable</p> <p>The instruments inhibit editing of non rhythm parts (destination > 10) and force the user to delete all events in the Style Creator. The setting only has meaning to Style Creator, and then not always there. If a destination channel has more than one source channel, then the instrument will not allow editing, regardless of this setting.</p>
11	<p>Note Mute (Part 1)</p> <p>Values 00H .. 0FH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one note. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = unused, always 0 Bit 6 = unused, always 0 Bit 5 = unused, always 0 Bit 4 = unused, always 0 Bit 3 = note B Bit 2 = note Bb Bit 1 = note A Bit 0 = note G#</p>	<p>Bit = 1 -> note will be played</p> <p>Bit = 0 -> note will NOT be played</p> <p>Example: 0EH (= 00001110B) means:</p> <ul style="list-style-type: none"> • Notes A, Bb, B will be played. • If note G# is pressed the accompaniment is muted. <p>For details about the meaning of these values see chapter 5.2.4.</p>
12	<p>Note Mute (Part 2)</p> <p>Values 00H .. FFH</p>	<p>Bit = 1 -> note will be played</p> <p>Bit = 0 -> note will NOT be played</p>

Style Files - Introduction and Details

	<p>This byte has to be interpreted as an array of bits. Each bit represents one note. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = note G Bit 6 = note F# Bit 5 = note F Bit 4 = note E Bit 3 = note Eb Bit 2 = note D Bit 1 = note C# Bit 0 = note C</p>	
13	<p>Chord Mute (Part 1) Values 00H .. 0FH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one chord type. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = unused, always 0 Bit 6 = unused, always 0 Bit 5 = unused, always 0 Bit 4 = unused, always 0 Bit 3 = ? (maybe unused?) Bit 2 = autostart enable Bit 1 = 1+2+5 Bit 0 = sus4</p>	<p>Bit = 1 -> when this chord is played the accompaniment is played. Bit = 0 -> when this chord is played the accompaniment is muted.</p> <p>Example: 02H (= 00000010B) means: When playing a sus4 chord the accompaniment is muted.</p> <p>Bit 2 and Bit 3 are only used for drum and percussion channels.</p> <p>If Bit 2 = 1 then Auto Start is enabled and the channel will play accompaniment before a chord is pressed. This allows the drums to play from the beginning and instruments to come in later.</p> <p>For details about the meaning of these values see chapter 5.2.3.</p>
14	<p>Chord Mute (Part 2) Values 00H .. FFH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one chord type. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = 1+5 Bit 6 = 1+8 Bit 5 = 7aug Bit 4 = Maj7aug Bit 3 = 7(#9) Bit 2 = 7(b13) Bit 1 = 7(b9) Bit 0 = 7(13)</p>	<p>Bit = 1 -> when this chord is played the accompaniment is played. Bit = 0 -> when this chord is played the accompaniment is muted.</p>
15	<p>Chord Mute (Part 3) Values 00H .. FFH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one chord type.</p>	<p>Bit = 1 -> when this chord is played the accompaniment is played. Bit = 0 -> when this chord is played the accompaniment is muted.</p>

Style Files - Introduction and Details

	<p>(Bit 7 = highest bit (MSB))</p> <p>Bit 7 = 7#11 Bit 6 = 7(9) Bit 5 = 7b5 Bit 4 = 7sus4 Bit 3 = 7th Bit 2 = dim7 Bit 1 = dim Bit 0 = minMaj7(9)</p>	
16	<p>Chord Mute (Part 4) Values 00H .. FFH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one chord type. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = minMaj7 Bit 6 = min7(11) Bit 5 = min7(9) Bit 4 = min(9) Bit 3 = m7b5 Bit 2 = min7 Bit 1 = min6 Bit 0 = min</p>	<p>Bit = 1 -> when this chord is played the accompaniment is played. Bit = 0 -> when this chord is played the accompaniment is muted.</p>
17	<p>Chord Mute (Part 5) Values 00H .. FFH</p> <p>This byte has to be interpreted as an array of bits. Each bit represents one chord type. (Bit 7 = highest bit (MSB))</p> <p>Bit 7 = aug Bit 6 = Maj6(9) Bit 5 = Maj7(9) Bit 4 = Maj(9) Bit 3 = Maj7#11 Bit 2 = Maj7 Bit 1 = Maj6 Bit 0 = Maj</p>	<p>Bit = 1 -> when this chord is played the accompaniment is played. Bit = 0 -> when this chord is played the accompaniment is muted.</p>

Style Files - Introduction and Details

18	Source Chord Values 00H .. 0BH	<p>Determines the original key of the source channel together with the following byte (i.e. the key used when recording the source channel). On the instruments the default, CMaj7 (the source root is "C" and the source chord type is "Maj7"), is automatically selected whenever the preset data is deleted prior to recording a new style, regardless of the source root and chord included in the preset data.</p> <p>00H = C 01H = C# 02H = D 03H = Eb 04H = E 05H = F 06H = F# 07H = G 08H = G# 09H = A 0AH = Bb 0BH = B</p>		
19	Source Chord Type Values 00H .. 21H	<table style="width: 100%; border: none;"> <tr> <td style="width: 50%; vertical-align: top;"> 00H = Maj 01H = Maj6 02H = Maj7 03H = Maj7#11 04H = Maj(9) 05H = Maj7(9) 06H = Maj6(9) 07H = aug 08H = min 09H = min6 0AH = min7 0BH = min7b5 0CH = min(9) 0DH = min7(9) 0EH = min7(11) 0FH = minMaj7 </td> <td style="width: 50%; vertical-align: top;"> 10H = minMaj7(9) 11H = dim 12H = dim7 13H = 7th 14H = 7sus4 15H = 7b5 16H = 7(9) 17H = 7#11 18H = 7(13) 19H = 7(b9) 1AH = 7(b13) 1BH = 7(#9) 1CH = Maj7aug 1DH = 7aug 1EH = 1+8 1FH = 1+5 20H = sus4 21H = 1+2+5 22H = cancel (stop all instruments) </td> </tr> </table>	00H = Maj 01H = Maj6 02H = Maj7 03H = Maj7#11 04H = Maj(9) 05H = Maj7(9) 06H = Maj6(9) 07H = aug 08H = min 09H = min6 0AH = min7 0BH = min7b5 0CH = min(9) 0DH = min7(9) 0EH = min7(11) 0FH = minMaj7	10H = minMaj7(9) 11H = dim 12H = dim7 13H = 7th 14H = 7sus4 15H = 7b5 16H = 7(9) 17H = 7#11 18H = 7(13) 19H = 7(b9) 1AH = 7(b13) 1BH = 7(#9) 1CH = Maj7aug 1DH = 7aug 1EH = 1+8 1FH = 1+5 20H = sus4 21H = 1+2+5 22H = cancel (stop all instruments)
00H = Maj 01H = Maj6 02H = Maj7 03H = Maj7#11 04H = Maj(9) 05H = Maj7(9) 06H = Maj6(9) 07H = aug 08H = min 09H = min6 0AH = min7 0BH = min7b5 0CH = min(9) 0DH = min7(9) 0EH = min7(11) 0FH = minMaj7	10H = minMaj7(9) 11H = dim 12H = dim7 13H = 7th 14H = 7sus4 15H = 7b5 16H = 7(9) 17H = 7#11 18H = 7(13) 19H = 7(b9) 1AH = 7(b13) 1BH = 7(#9) 1CH = Maj7aug 1DH = 7aug 1EH = 1+8 1FH = 1+5 20H = sus4 21H = 1+2+5 22H = cancel (stop all instruments)			
20	Note Transposition Rule (NTR) Values 00H .. 01H	<p>Specifies the transposition rule to be used by the transposition table.</p> <p>00H = Root Transposition 01H = Root Fixed</p> <p>For details about the meaning of these values see chapter 5.2.5.</p>		
21	Note Transposition Table (NTT) Values 00H .. 05H	<p>Specifies the note transposition table to be used for source pattern transposition.</p> <p>00H = Bypass 01H = Melody 02H = Chord 03H = Bass 04H = Melodic Minor 05H = Harmonic Minor</p>		

Style Files - Introduction and Details

		For details about the meaning of these values see chapter 5.2.6.
22	High Key Values 00H .. 0BH	<p>Specifies the upper root limit. Chords with a root higher than the specified limit will be played in the octave immediately below the high-key limit. This setting is effective only when the NTR (Note Transposition Rule) (above) is set to "Root Trans".</p> <p>00H = C 01H = C# 02H = D 03H = Eb 04H = E 05H = F 06H = F# 07H = G 08H = G# 09H = A 0AH = Bb 0BH = B</p> <p>For details about the meaning see chapter 5.2.8.</p>
23	Note Low Limit Values 00H .. 7FH	<p>The values 00H .. 7FH represent the midi note numbers 0 .. 127.</p> <p>"Note Low Limit" and "Note High Limit" specify the low and high note limits for all notes in the specified part. Notes outside this range are transposed to the nearest octave within the range.</p> <p>For details about the meaning see chapter 5.2.7.</p>
24	Note High Limit Values 00H .. 7FH	<p>The values 00H .. 7FH represent the midi note numbers 0 .. 127.</p> <p>For details about the meaning see chapter 5.2.7.</p>
25	Retrigger Rule (RTR) Values 00H .. 05H	<p>Specifies how notes held through chord changes will be handled.</p> <p>00H = Stop 01H = Pitch shift 02H = Pitch shift to root 03H = Retrigger 04H = Retrigger to root 05H = Note generator</p> <p>For details about the meaning of these values see chapter 5.2.9.</p>
26..n	Special features	<p>One or more data bytes.</p> <p>If the value of byte 26 is 00H (= no special feature), then there are no following bytes.</p> <p>If the value of byte 26 is 01H (=extra break drum voice), then there are 4 following bytes (bytes 27...30).</p> <p>For more details see chapter 5.2.10.</p>

Table 11

4.6.3.4 Cntt structure

Immediately after the last Ctab structure there may be one or more optional Cntt structures. The number of Cntt structures has to be derived from the size of the CSEG data. Alternatively, the following data may be examining by looking for repeating "Cntt" section identifiers.

It seems that for (newer) instruments supporting the Cntt structure, the data in the Cntt structure overrides the data of the corresponding NTT.

The presence of Cntt data in the CASM section of a style file is incompatible with the Mixer in some (older) models, e.g. PSR 740. The Mixer (PSR 740 manual page 90) just don't work.

Details about the structure of the Cntt structure:

Byte Index		Description
0..3	byte[0] = 'C' (43H) byte[1] = 'n' (6EH) byte[2] = 't' (74H) byte[3] = 't' (74H)	This 4-character sequence identifies this section as a Cntt structure. Note: The characters are case sensitive.
4...7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte which is counted here is byte[8]. As the Cntt is a two byte record, this value is always = 2.
8	Source Channel Values 00H .. 0FH	Midi source channel. The values 00H .. 0FH represent the midi channels 1..16.
9	Note Transposition Table Bit 7 indicates Bass on/off Bits 6 .. 0 define the table type (Bit 7 = highest bit (MSB))	00H / 80H = Bypass 01H / 81H = Melody 02H / 82H = Chord 03H / 83H = Bass 04H / 84H = Melodic minor 05H / 85H = Harmonic minor 06H / 86H = Harmonic minor 5 th Var. 07H / 87H = Natural minor 08H / 88H = Natural minor 5 th Var. 09H / 89H = Dorian minor 0AH / 8AH = Dorian minor 5 th Var. If Bass is off values 00H - 0AH are used, else values 80H - 8AH. The part (channel) for which Bass is set to On recognizes on-bass chords allowed in the Fingered-on-Bass fingering mode, regardless of the NTT setting. For details about the meaning of these values see chapter 5.2.6.

Table 12

4.7 OTS (One Touch Setting) section

The OTS is used to establish keyboard settings that can be saved and recalled from a style, and is generally used to set up the right/left voices. OTS data includes similar, but fewer, settings than a registration.

4.7.1 General

The OTS settings are stored in the OTS section of a style file in form of OTS tracks. Each OTS setting corresponds to one OTS track.

4.7.2 General structure

The OTS section consists of a section id, section length, and the OTS data. The OTS data itself consists of one or more OTS tracks. The number of OTS tracks follows from the section length and the length of the individual OTS tracks. Each OTS track also contains the information about its size.

Note: The file format allows that there may be an OTS section with no OTS tracks; the section length is 0 in this case. As it makes no sense to have an empty OTS section, programs creating/modifying styles should not create such empty OTS sections. In this case no OTS section should be created in the style file.

Details about the structure of the OTS section:

Byte Index		Description
0..3	byte[0] = 'O' (4FH) byte[1] = 'T' (54H) byte[2] = 'S' (53H) byte[3] = 'c' (63H)	This 4-character sequence identifies this section as an OTS section. Note: The characters are case sensitive.
4...7	Nr of data bytes = $256 * 256 * 256 * \text{byte}[4]$ + $256 * 256 * \text{byte}[5]$ + $256 * \text{byte}[6]$ + $\text{byte}[7]$	Indicates the nr of data bytes following. This means, the first byte which is counted here is byte[8].
8..n	Data bytes (Number as given above)	OTS data. More details are described in chapter 4.7.3

Table 13

4.7.3 OTS data

The OTS data consists of one or more OTS tracks. The number of OTS tracks follows from the section length and the length of the individual OTS tracks. Therefore the number of OTS

Style Files - Introduction and Details

tracks is variable. Currently a maximum of 4 is used, but the file format supports any number of OTS tracks.

An OTS track is a standard midi track.

So the following data structure may exist multiple times inside the OTS data area shown above. This can be derived from the size of the OTS data area and the size of the individual OTS midi tracks.

Byte Index		Description
0..3	byte[0] = 'M' (4DH) byte[1] = 'T' (54H) byte[2] = 'r' (72H) byte[3] = 'k' (6BH)	This 4-character sequence identifies the following data as an OTS track, which is in standard midi track format. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of data bytes following. This means, the first byte which is counted here is byte[8].
8..x	Data bytes (Number as given above)	OTS (midi) track data. These data bytes form a standard midi track.

Table 14

4.8 MDB (Music Finder) section

The music finder function supports the musician in setting up the keyboard for playing a certain song.

When activated on the keyboard, the music finder function shows a list of song titles (also called a list of song records). For each song title there are additional fields for style, tempo and time signature. If the musician selects a song, the keyboard will load the associated style and adjusts the tempo.

There are some more fields (genre, keyword1 and keyword2), which are used by the music finder search function.

4.8.1 General

The assignment between the song title and style, tempo, time signature, is done in the style file via so-called MDB records, which are stored in the MDB section of the style file. One MDB record defines one song title and the associated information. There may be any number of MDB records in a style file.

4.8.2 MDB section

Byte Index		Description
0..3	byte[0] = 'F' byte[1] = 'N' byte[2] = 'R' byte[3] = 'c'	This 4-character sequence identifies this section as a MDB section. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the length of the MDB section. The first byte counted is byte[8].
8..n	Data bytes (Number as given above)	MDB data area. This area contains one or more MDB records described in chapter 4.8.3.

Table 15

4.8.3 MDB record

Byte Index		Description
0..3	byte[0] = 'F' byte[1] = 'N' byte[2] = 'R' byte[3] = 'P'	This 4-character sequence identifies the following data as a MDB record, which contains the data for one song.
4..7	Nr of data bytes = 256*256*256*byte[4]	Indicates the length (in number of bytes) of the MDB record data. The first byte counted is

Style Files - Introduction and Details

	+ 256*256*byte[5] + 256*byte[6] + byte[7]	byte[8].
8..n	Data bytes (Number as given above)	MDB record data. More details are described in chapter 4.8.4.

Table 16

4.8.4 MDB record data

Byte Index		Description
0..2	tempo = 256*256*byte[0] + 256*byte[1] + byte[2]	Tempo Unit: Microseconds per quarter note. Note: To calculate the tempo in BPM: BPM = 60,000,000 / tempo_in_microseconds
3..4	byte[3] = beats per measure byte[4] = note that gets one beat	Time signature (e.g. for a waltz: byte[3] = 3 byte[4] = 4)
5..n	Data bytes (The number is variable)	MDB song title data record. More details are described in chapter 4.8.5.
n1..n2	Data bytes (The number is variable)	MDB genre data record. More details are described in chapter 4.8.6.
n3..n4	Data bytes (The number is variable)	MDB keyword1 data record More details are described in chapter 4.8.7
n5..n6	Data bytes (The number is variable)	MDB keyword2 data record More details are described in chapter 4.8.8.

Table 17

4.8.5 MDB song title data record

Byte Index		Description
0..3	byte[0] = 'M' byte[1] = 'n' byte[2] = 'a' byte[3] = 'm'	This 4-character sequence identifies the following data as the title of the song.
4..7	titlelength = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the length (in number of bytes) of the following character sequence. The first byte counted is byte[8].
8..n	byte[8] = 'x' byte[9] = 'x' byte[10] = 'x' : : : byte[titlelength+7]	The title of the song.

Table 18

4.8.6 MDB genre title data record

Byte Index		Description
0..3	byte[0] = 'G' byte[1] = 'n' byte[2] = 'a' byte[3] = 'm'	This 4-character sequence identifies the following data as the name of the genre.
4..7	genrelength = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the length (in number of bytes) of the following character sequence. The first byte counted is byte[8].
8..n	byte[8] = 'x' byte[9] = 'x' byte[10] = 'x' : : : byte[genrelength+7]	The genre of the song

Table 19

4.8.7 MDB keyword1 record

Byte Index		Description
0..3	byte[0] = 'K' byte[1] = 'w' byte[2] = 'd' byte[3] = '1'	This 4-character sequence identifies the following data as the keyword1.
4..7	keyword1length = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the length (in number of bytes) of the following character sequence. The first byte counted is byte[8].
8..n	byte[8] = 'x' byte[9] = 'x' byte[10] = 'x' : : : byte[keyword1length+7]	The keyword1

Table 20

4.8.8 MDB keyword2 record

Byte Index		Description
0..3	byte[0] = 'K' byte[1] = 'w' byte[2] = 'd' byte[3] = '2'	This 4-character sequence identifies the following data as the keyword2.
4..7	keyword2length = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the length (in number of bytes) of the following character sequence. The first byte counted is byte[8].

8..n	byte[8] = 'x' byte[9] = 'x' byte[10] = 'x' : : byte[keyword2length+7]	The keyword2
------	--	--------------

Table 21

4.9 MH Section

This section can be found in a very small number of style files. Typically the section is at the end of the style file. Nothing is known about the purpose of this section. (Maybe the section is related to PSR-8000 keyboards?)

Details of general structure for the MH section:

Byte Index		Description
0..3	byte[0] = 'M' (4DH) byte[1] = 'H' (48H) byte[2] = 'h' (68H) byte[3] = 'd' (64H)	This 4-character sequence identifies this section as a MH section. Note: The characters are case sensitive.
4..7	Nr of data bytes = 256*256*256*byte[4] + 256*256*byte[5] + 256*byte[6] + byte[7]	Indicates the nr of header data bytes following. This means, the first byte which is counted here is byte[8]. The length of the MHhd header is always 8 bytes.
8..15	Data bytes	MHhd header data.
16..19	byte[16] = 'M' (4DH) byte[17] = 'H' (48H) byte[18] = 't' (74H) byte[19] = 'r' (72H)	This 4-character sequence identifies the MHtr track. Note: The characters are case sensitive.
20..23	Nr of data bytes = 256*256*256*byte[20] + 256*256*byte[21] + 256*byte[22] + byte[23]	Number of bytes in the MHtr track. This means, the first byte that is counted here is byte[24].
24..n	Data bytes (Number as given above)	MHtr track data. Nothing is known about the purpose of this data.

Table 22

5 Style File Data

This chapter describes the details about the meaning, functionality and requirements about the data stored in the style file sections described in chapter 4.

5.1 Midi section

For the following description it is helpful to have a basic knowledge of midi and standard midi files. For some links to midi tutorials and midi specifications see chapter 7.2.

Style Files - Introduction and Details

5.1.1 Meaning, Functionality and Requirements of Midi Data used in Styles

The midi section of a style consists of some initial file related data, then two initializing markers SFF1 and SInt used to initialize the PSR/Tyros, set up instrument voices, and the markers used to delineate the midi patterns by the selected sections (e.g. Main A, Ending B).

Generally a style should include at least Main A, Intro A, Ending A and Fill AA sections. The instrument will operate with less, but other users will miss these basic sections. However, all styles should have a Main A. Some instruments will not load them otherwise. Also, if a style does not have all fill sections for all contained main parts, then the Ending A may repeat (e.g. if you are playing Main B and you call Ending A, but there is no Fill BB).

Markers are case sensitive and correct spelling, including spaces, is critical.

Valid markers are:

Intro A	Main A	Fill In AA	Ending A
Intro B	Main B	Fill In BB	Ending B
Intro C	Main C	Fill In CC	Ending C
	Main D	Fill In DD	
		Fill In BA	
		Fill In AB (only for PSR 8000)	

Table 23

Note: "Fill In BA" represents the "Break" section.

Not all midi events are processed by style files in any section of the midi data. See the table below:

Event	Setup Sections (SFF1, SInt)	Other Sections
Note Off	—	OK
Note On	—	OK
Program Change	OK	OK
Pitch Bend	OK	OK
Control#0 (Bank Select MSB)	OK	OK
Control#1 (Modulation)	OK	OK
Control#6 (Data Entry MSB)	OK	—
Control#7 (Master Volume)	OK	OK
Control#10 (Panpot)	OK	OK
Control#11 (Expression)	OK	OK
Control#32 (Bank Select LSB)	OK	OK
Control#38 (Data Entry LSB)	OK	—
Control#71 (Harmonic Content)	OK	OK

Style Files - Introduction and Details

Control#72 (Release Time)	OK	—
Control#73 (Attack Time)	OK	—
Control#74 (Brightness)	OK	OK
Control#84 (Portamento Control)	—	OK

Control#93 (Chorus Send Level)	OK	OK
Control#94 (Variation Send Level)	OK	OK
Control#98 (NRPN LSB)	OK	—
Control#99 (NRPN MSB)	OK	—
Control#100 (RPN LSB)	OK	—
Control#101 (RPN MSB)	OK	—

Table 24

5.1.1.1 Measure 1

The following midi data has to be completed in the first measure of the midi data. Usually all events are on measure 1, beat 1, tick 0 (1:01:000). It is important that they are located in the file in the sequence as mentioned below.

Initial data: The first commands after the midi track header are usually time signature, tempo and copyright (optional). Time Signature is used to determine the metronome behavior and perhaps the score display; its value does not affect the play back of the note events. This is determined by the time values associated with the note on-off events. The tempo sets the default tempo of the instrument.

SFF1: This marker must come before the Slnt marker. It is followed by the StyleName, which is a Meta Event identified by ID=3 (see Table 6). The length of meta text events (except copyright) usually is limited in practice to a size which fits in a PSR display field. In factory styles, StyleName is generally followed by sysex events that define the style (see Table 25). The importance of these sysex is not understood.

Sysex Event	Description
F0 43 76 1A 10 00 01 01 01 00 01 00 00 F7	XGWorks Style code
F0 43 73 39 11 00 46 00 F7	Clavinova function
F0 43 73 01 51 05 00 01 08 00 00 00 00 00 00 00 F7	Clavinova function
F0 43 73 01 51 05 00 02 08 00 00 00 00 00 00 00 F7	Clavinova function

Table 25

Slnt: The Slnt marker must be after the above data and is generally followed by Midi On, Controller and Program Change Midi Events necessary to initialize the midi channels and sysex to set up the DSP:

Command	Description
F0 7E 7F 09 01 F7	Midi On sysex
BX, 7, volume data (0-127)	Control Change Volume
BX, 91, level data (0-127)	Control Change Reverb Send Level
BX, 93, level data (0-127)	Control Change Chorus Send Level
BX, 0, MSB value (0-127)	Control Change Bank Select MSB
BX, 32, LSB value (0-127)	Control Change Bank Select LSB
CX, program change number (0-127)	Program Change; Note: For XG voices to be properly recognized, the program change must be preceded by MSB & LSB Bank Select Events.
F0 43 10 4C 02 01 00 DD DD F7	Reverb Type; DD from Effects List
F0 43 10 4C 02 01 20 DD DD F7	Chorus Type; DD from Effects List
F0 43 10 4C 02 01 40 DD DD F7	Variation Type; DD from Effects List
F0 43 10 4C 02 01 5A TT F7	Variation Connection Type;

Style Files - Introduction and Details

	for styles, TT = 01 (system)
F0 43 10 4C 08 08 07 03 F7	Channel 9 assigned to drums 1
F0 43 10 4C 08 09 07 02 F7	Channel 10 assigned to drums 2

Table 26

Any following sections use these definitions until they are overwritten. E.g.; if channel 1 has a program change in SInt and Main C, then channel 1 will use the SInt definitions until Main C is played. Thereafter channel 1 will use the new definition. For this reason, if any changes are made in a section following SInt, then all sections should have commands which establish these parameters.

5.1.1.2 Measure 2 and following measures

Measures 2 and following contain the musical patterns of the style.

Intros, Mains, Endings, Fill Ins, Break: These can be in any order, and should begin in measure 2. Primarily midi events include note-on and note off, controller (e.g. expression), pitch wheel and program change events. Fill Ins and Break are limited to a single measure; other sections can be any length but are generally ≥ 4 measures.

5.1.2 Midi Channel Usage

The accompaniment system supports the following midi channels for accompaniment input:

Acc. Channel	Acc. Part	Usage
9	Sub-Rhythm	Secondary percussion instruments.
10	Rhythm	Main percussion instruments.
11	Bass	Main bass instrument.
12	Chord 1	Often used for rhythm guitar.
13	Chord 2	Often used for piano.
14	Pad	Often used for violins or similar.
15	Phrase 1	Often used for brass instruments.
16	Phrase 2	Often used for brass instruments.

Table 27

The midi section may either follow these channel assignment, or a CASM section has to be added to the style. A CASM section allows mapping any midi channel to the required accompaniment channels (see chapter 5.2).

5.1.3 Key and allowed Notes

During playback the accompaniment system transposes the musical sections of the style according to the chord currently played by the musician. For this the instrument needs to know the original key of the musical section. If nothing is stated the instrument assumes the key CMaj7. If the key of the musical section is not CMaj7, a CASM section has to be added to the style. A CASM section allows using any key (see chapter 5.2.2).

There are restrictions about the notes which are allowed to be used in the style. Using other notes may lead to a wrong transposition.

The allowed notes are:

Acc. Channel	Acc. Part	Allowed notes (based on CMaj7)
9	Sub-Rhythm	All
10	Rhythm	All
11	Bass	C, D, E, G, A, B

Style Files - Introduction and Details

12	Chord 1	C, E, G, B
13	Chord 2	C, E, G, B
14	Pad	C, E, G, B
15	Phrase 1	C, D, E, G, A, B
16	Phrase 2	C, D, E, G, A, B

Table 28

For Intro and Ending sections autonomously playing all chord changes, which means that for these sections no transposition will be performed (selected in the corresponding NTT, see chapter 5.2.6), all notes are allowed also in acc. channels 11 .. 16 of these sections.

5.1.4 Voices

Styles may use any factory voices, except SA and organ flute voices. User voices made by editing preset voices cannot be used. In the Tyros 2, Custom Voices are allowed. (Note: SA voices can be assigned using PC programs; it is not known if this has any negative consequences.)

Voices are identified by two values. The bank and the program (= instrument) number. The bank number defines a group of instruments; the program number identifies the instrument inside this group. The bank number is usually given as a two byte value MSB (Most Significant Byte) and LSB (Least Significant Byte).

Currently the following voices are known:

Voice Type	Voice Bank (MSB)	Voice Bank (LSB)	Program Nr.
GM	0	0	0 .. 127
XG	0	0 .. 101	0 .. 127
Panel	0	102 .. 127	0 .. 127
Mega and Super Articulation	8	0 .. 127	0 .. 127
Sound Effects	64	0	0 .. 127
GM2 Drums	120	0	0 .. 127
GM2	121	0 .. 127	0 .. 127
Drum and Percussion, Special Effects	126 .. 127	0	0 .. 127

Table 29

When using these voices it has to be taken into account that not all voices are available on all keyboard models. If a style uses a voice that is not supported by the keyboard, and the MSB Bank Select value is zero, the instrument will automatically substitute the voice. Therefore the style will work, but it will sound (maybe only slightly) different. The result of this substitution may sound acceptable (e.g. when substituting XG and GM voices) or unusable (e.g. when substituting Mega voices with GM voices).

There are software programs available, which can substitute voices in styles in a more sophisticated way, to adapt them for various keyboard models. See chapter 7.1.

A similar problem may arise when the style uses a drum kit, which is not available on the keyboard model. Then wrong percussion instruments may be used.

Currently no software program is known, which supports total (MidiPlayer does Latin Kits) remapping of drum kits, so this has to be done manually.

5.1.5 Special Effects

5.1.5.1 Half Bar Fill Ins

The Fill In section of a style has to be one measure in length. If a style should have a Fill In section that is only a half measure in length, this is not possible in the common way, but by a trick. For the Fill In measure the tempo is doubled (therefore the measure plays in $\frac{1}{2}$ of the time of an original measure) and all note event durations in this measure are doubled (so that the notes and rests have again the original duration).

This modification is supported by the programs "StyleAdjust" and "Style Half Bar Fill Creator" (see chapter 7.1.3).

5.1.5.2 Multiple Time Signatures

In general styles can only have one time signature. But, by the same trick used for the "Half Bar Fill Ins", this can also be achieved by increasing/decreasing the tempo and decreasing/increasing the note event durations in the opposite direction.

This modification is supported by the program "Style Tempo Editor" (see chapter 7.1.3).

5.1.6 Restrictions for older keyboard models

This chapter lists restrictions for older keyboard models, which are not mentioned before.

Midi file resolution: Is limited to max. 480 ticks per quarter note for e.g. PSR7000 and PSR8000 (?).

5.2 *CASM section*

This chapter will provide information which is useful when creating or modifying CASM data using one of the CASM editors or style creation programs.

The CASM section gives instructions to the instrument on how to deal with the midi data. It provides additional possibilities to create more diversified styles.

The CASM section allows defining separate instructions for each style part (e.g. Intro A, Main B) of each source midi channel. To reduce the complexity, some CASM editor programs may only support defining separate instructions for each source midi channel, treating all style parts the same. However, these sections can be easily expanded as required.

5.2.1 Styles without a CASM Section

Style files do not necessarily need a CASM section, as long as the midi section of the style follows these rules:

- Only midi channels 9 .. 16 are used.
- Usage of midi channels is according to Table 27.
- Midi channels have to be based on key CMaj7.
- There is only one channel per part (i.e. no separate channel for major and minor chord types)

5.2.2 Midi channel usage and assignment

The accompaniment system supports 8 midi channels (accompaniment channels) as listed in Table 27.

If no CASM section is present in the style file, then the accompaniment system assumes that the midi part of the style file only uses these midi channels, with the assignment according to Table 27.

A CASM section instead allows using up to 16 midi channels in the midi part of the style file. These “source channels” are then assigned to the 8 “accompaniment channels”. In the instrument, any source channel can be assigned to any accompaniment channel, with the restriction that drum voices can only be assigned to the Rhythm channel (10); the SubRhythm channel can accept both. Multiple source channels can be assigned to a single accompaniment channel. In PC programs, any instrument can be assigned to any channel.

In general, any voice non-drum channel can be assigned to any of the accompaniment channels 11 .. 16, as it seems that they work quite equally. E.g. a source channel containing chord data may be assigned to accompaniment channel 11, which is identified as the Bass part on the instrument. Since the instrument display always calls channel 11 “Bass”, it would be confusing if the channel does not contain the bass pattern.

When assigning the channels the restrictions regarding the allowed notes have to be followed according to Table 28.

This provides e.g. the following possibilities:

- One accompaniment channel can play more than one instrument depending upon the chord type, if source tracks redefine the voice.
- One accompaniment channel can play different instruments in style sections by redefining the voice within the style section.

5.2.3 Chord Mute

Normally the accompaniment is played by the instrument continuously until it is stopped or an ending part has been finished. The “Chord Mute” allows the style to define chord types, which when played, temporarily mute the accompaniment contributed by that track. Use chord type “cancel” to mute all instruments.

This can be specified for each style part of each source midi channel.

Valid chord types are:

Maj	min6	dim7	7(#9)
Maj6	min7	7 th	Maj7aug
Maj7	min7b5	7sus4	7aug
Maj7#11	min(9)	7b5	1+8
Maj(9)	min7(9)	7(9)	1+5
Maj7(9)	min7(11)	7#11	sus4
Maj6(9)	minMaj7	7(13)	1+2+5
Aug	minMaj7(9)	7(b9)	cancel
Min	dim	7(b13)	

Table 30

This provides e.g. the following possibilities:

- Different patterns play in response to chord types (Maj, min, ...).
- The whole non rhythm accompaniment can be muted by keying a cancel chord (equal to three consecutive keys in Fingered Mode).
- The whole non rhythm accompaniment excluding the bass can be muted by keying a cancel chord (equal to four consecutive keys in Fingered Mode).
- Dedicated source channels can be muted to disable a voice at certain times during playback by keying a dedicated chord.

- Dedicated source channels can be unmuted to enable a voice at certain times during playback by keying a dedicated chord.

5.2.4 Note Mute

The “Note Mute” allows the style to mute (or enable) a track based upon the Root Chord.

E.g. when C is disabled for a bass track, then keying chords C, Cm etc. mutes the bass track.

5.2.5 Note Transposition Rule (NTR)

This specifies what notes of the possible chord notes will be played when a chord is transposed. There are two modes available:

- **Root Transposition:**
When transposed the pitch relationship between notes is maintained, i.e. the same inversion of the chord is used. For example, the notes C3, E3, and G3 in the key of C will become F3, A3, and C4 when transposed to F. Use this setting for parts that contain melodic lines.
- **Root Fixed:**
The note is kept as close as possible to the previous note range, i.e. a different inversion of the chord may be used. For example, the notes C3, E3, and G3 in the key of C will become C3, F3, and A3 when transposed to F. Use this setting for chordal parts, e.g. for rhythm guitar parts.

5.2.6 Note Transposition Table (NTT)

The note transposition table specifies the method to be used for source pattern transposition.

- **Bypass: No transposition.**
No transposition. Playback is independent of the chord used during playback. This has to be used for drum channels (as these notes should never be transposed) and for other special effects sounds.

Sometimes used for Intros and Endings

- **Melody:**
Should be used for melodic channels that are assigned to accompaniment channels “Phrase 1” and “Phrase 2”.
- **Chord:**
Should be used for chord oriented channels that are assigned to accompaniment channels “Chord 1” and “Chord 2” when they contain piano or guitar-like chordal parts.
- **Bass:**
Should be used for bass channels that are assigned to accompaniment channel “Bass”.
- **Melodic Minor:**
Should be used for melodic channels that are assigned to accompaniment channels “Phrase 1” and “Phrase 2” for style parts where only major/minor chords are played, e.g. Intros and Endings.
Lowers the third scale degree by a semitone when the played chord changes from a

major to a minor chord, or raises the minor third scale degree a semitone when changing from a minor to a major chord. Other notes are not changed.

- **Harmonic Minor:**
Should be used for chord oriented channels that are assigned to accompaniment channels "Chord 1" and "Chord 2" for style parts where only major/minor chords are played, e.g. Intros and Endings.
Lowers the third and sixth scale degrees by a semitone when changing from a major to a minor chord, or raises the minor third and flatted sixth scale degrees a semitone when changing from a minor to a major chord. Other notes are not changed.
- **Harmonic minor 5th Var:** (only available if the "Cntt" structure in the style file is supported)
- **Natural minor:** (only available if the "Cntt" structure in the style file is supported)
- **Natural minor 5th Var:** (only available if the "Cntt" structure in the style file is supported)
- **Dorian minor:** (only available if the "Cntt" structure in the style file is supported)
- **Dorian minor 5th Var:** (only available if the "Cntt" structure in the style file is supported)

5.2.7 Note Limits

The values 00H .. 7FH represent the midi note numbers 0 .. 127.

"Note Low Limit" and "Note High Limit" specify the low and high note limits for all notes played in the specified part. If a transposed note is outside this range, then the note is transposed to the nearest octave within the range. The range must be at least one octave.

This can be used to ensure that only notes are played that are in the range of the respective instrument.

Example: When LOW = C3 and HIGH = D4
Root Motion: C C# D#
Notes Produced: E3-G3-C4 / F3-G#3-C#4 / D#3-G3-A#3

5.2.8 High Key

Specifies the upper root limit. Chords with a root higher than the specified limit will be played in the octave immediately below the high-key limit. This setting is effective only when the NTR (Note Transposition Rule) is set to "Root Trans".

This is used to keep bass lines to a bass range.

Example: When HIGH KEY = F.
Root Motion: C C# D F F#
Notes Produced: C3-E3-G3 / C#3-F3-G#3 / D3-F#3-A3 / F3-A3-C4 / F#2-A#2-C#3

5.2.9 Retrigger Rule (RTR)

Specifies how notes behave through chord changes.

- **Stop:**
The note is stopped.

Style Files - Introduction and Details

- Pitch shift:
The pitch of the note will bend without attack to match the type of the new chord.

Pitch shift to root:
The pitch of the note will bend without attack to match the root of the new chord.

Retrigger:
The note is retriggered with attack at a new pitch matching the new chord type.

Retrigger to root:
The note is retriggered with attack at a new pitch matching the new chord root.

Note generator:
This setting will only be available if programmed in the original style. A designated note is produced with designated pitch, length, and velocity matching the new chord.

5.2.10 Special Features

At the end of the Ctab structure special features can be defined for a midi source channel. Currently there is only one special feature ("extra break drum voice") used by a very small number of styles.

An extra break drum voice (e.g. a Crash Cymbal) can be added when playing the 3- or 4-finger break. The extra break drum voice will sound at time 0 within the break measure.

For this purpose there must be created a MIDI channel in the MIDI part of the style file with only the Drum Set definition (Program Change, MSB and LSB); and NO notes. This (almost empty) channel must be redirected to a Keyboard Drum Channel (Rhythm Sub or Rhythm Main). Furthermore the extra drum voice and its volume can be defined.

For this MIDI channel a "normal" Ctab structure with the following exceptions must be created:

Byte Index	Description	Value
9	Destination channel	08H = Sub Rhythm or 09H = Rhythm
11	Note Mute (Part 1)	0FH
12	Note Mute (Part 2)	FFH
13	Chord Mute (Part 1)	04H
14	Chord Mute (Part 2)	00H
15	Chord Mute (Part 3)	00H
16	Chord Mute (Part 4)	00H
17	Chord Mute (Part 5)	00H
18	Source Chord	00H
19	Source Chord Type	00H
20	Note Transposition Rule (NTR)	01H
21	Note Transposition Table	00H
22	High Key	00H
23	Note Low Limit	00H
24	Note High Limit	7FH
25	Retrigger Rule (RTR)	03H
26	Special feature id	01H = "extra break drum voice"
27	Meaning unknown	00H
28	Meaning unknown	18H
29	Instrument	Typical instruments are:

		31H = Crash Cymbal 1 32H = Crash Cymbal 2
30	Volume	00H .. 7FH (0 .. 127)

Table 31

6 Credits

The authors of this document wish to express their gratitude to all the members of the PSR community who have shared their knowledge and experience on style making and style files, and especially to some of the early pioneers in style file programming: Jørgen Sørensen, Dan Phalen, Heiko Plate and Evgeny Osenenko.

7 Links

7.1 Software

This chapter provides links to free software. The list may not be complete.

7.1.1 General Style Software

Midi and Style Player (by Jørgen Sørensen)

(Note: A standard midi player will not produce an acceptable result for styles.)

<http://www.jososoftware.dk/yamaha/software.htm>

MidiPlayer (by Michael P. Bedesem)

Supports playing midi, style, voice, multipad, wav and mp3 files on a PC. Views all internals of a style file in detail..

(Note: A standard midi player will not produce an acceptable result for styles.)

<http://psrtutorial.com/MB/midiplayer.html>

StyleDump (by Michael P. Bedesem)

Views all internals of a style file in detail. (Unlike MidiPlayer, StylePlayer does not convert or modify the file in any way.)

<http://psrtutorial.com/MB/styledump.html>

StylePlayer (by Michael P. Bedesem)

Supports playing style files on a PC. Similar to MidiPlayer but more focused on style playing.

(Note: A standard midi player will not produce an acceptable result for styles.)

<http://psrtutorial.com/MB/styleplayer.html>

7.1.2 Style Adaptation Software

This section lists software which may be used if a style should only be adapted to a different keyboard model.

MidiPlayer (by Michael P. Bedesem)

Supports various functions to convert styles for the different PSR instruments.

<http://psrtutorial.com/MB/midiplayer.html>

Style Old Format Converter (by Jørgen Sørensen)

Converts styles for use on older/smaller keyboards.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Revoicer (by Jørgen Sørensen)
Change voices and parameters, transpose etc. in style files.
<http://www.jososoftware.dk/yamaha/software.htm>

7.1.3 Style Modification Software

This section lists software which may be used to modify a style in various ways.

Style Creator (in the PSR/Tyros)

CasmEdit (by Evgeny Osenenko)
Manipulate style files and create and modify CASM sections.
http://www.mnppsatur.ru/osenenko/Main_eng.htm

CASM Editor
Displays and edits the CASM section.
<http://www.jososoftware.dk/yamaha/software.htm>

MDB Editor (by Jørgen Sørensen)
Add, edit or delete records in the MDB section in style files.
<http://www.jososoftware.dk/yamaha/software.htm>

MidiPlayer (by Michael P. Bedesem)
Edit channel transpose, OTS and individual (vs measure) voice, volume, pan, tempo, and effect events. Converts styles (voices, volumes, OTS) from one instrument to another (including MegaVoice to standard voice) .
<http://psrtutorial.com/MB/midiplayer.html>

OTS Editor (by Jørgen Sørensen)
Edit all parameters in OTS sections.
<http://www.jososoftware.dk/yamaha/software.htm>

PsrStyleDatabase (by Peter Wierzba)
Can also add, edit or delete records in the MDB section in style files.
<http://www.wierzba.homepage.t-online.de/>

StyleAdjust (by Michael P. Bedesem)
This program permits unlimited experimentation with the Tempo and note duration of a style
<http://psrtutorial.com/MB/bedesem.html> (available by email request to mpb@sover.net)

StyleEdit (by Michael P. Bedesem)
Edit internal stylename, tempo, copyright info and main section order for a PSR style.
<http://psrtutorial.com/MB/bedesem.html> (available by email request to mpb@sover.net)

StyleFix (by Michael P. Bedesem)
Convert internal names from numbers to names, replace bass voices for older instruments, exchange CD for AB sections, add a Break, remove OTS/MF Database sections.
<http://psrtutorial.com/MB/bedesem.html> (available by email request to mpb@sover.net)

Style Half Bar Fill Creator (by Jørgen Sørensen)
Create fill in's and breaks of half the normal bar length, e.g. a 2/4 fill in a 4/4 style file.
<http://www.jososoftware.dk/yamaha/software.htm>

StyleMaker (by Michael P. Bedesem)
This program supports editing an existing style file in a sequencer, or creating a PSR style from a midi song file, or midi/style templates (including Band In The Box styles).
<http://psrtutorial.com/MB/stylemaker.html>

Style ReMixer (by Jørgen Sørensen)

Remix style parts in styles.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Revoicer (by Jørgen Sørensen)

Change voices and parameters, transpose etc. in style files.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Split and Splice (by Jørgen Sørensen)

Split and splice style files for editing the midi part of the style file with sequencer software.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Tempo Editor (by Jørgen Sørensen)

Set individual tempo in style parts.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Time and Tempo in Name (by Jørgen Sørensen)

Add time signature and tempo values in the style file name.

<http://www.jososoftware.dk/yamaha/software.htm>

Style Time Editor (by Jørgen Sørensen)

Set individual time signatures in style parts.

<http://www.jososoftware.dk/yamaha/software.htm>

StyleUpdater (by Michael P. Bedesem)

Updates any style by allowing replication of missing sections, revoicing of individual parts, octave shifting, velocity shifts and part muting.

<http://psrtutorial.com/MB/bedesem.html> (available by email request to mpb@sover.net)

Visual Styler (by MojoFlux)

Copy style parts from more style files to one single style file.

<http://www.crestonhall.com/music.htm>

7.1.4 Style Making Software

This section lists software which may be used to create styles from scratch or from midi files.

Style Creator (in the PSR/Tyros)

Midi2style (by Jørgen Sørensen)

For creating style files from midi files.

<http://www.jososoftware.dk/yamaha/software.htm>

StyleMaker (by Michael P. Bedesem)

<http://psrtutorial.com/MB/stylemaker.html>

7.2 *Midi Specification and Tutorials*

This chapter provides links to documents explaining the MIDI system.

9 Open Issues and Questions

Following is a list of various questions. If anybody can contribute any answers or hints, please contact the authors to help making this document more complete.

1. Are there differences concerning the contents of the style file types (.sty, .bcs, .prs,...) ? None have been noticed so far.
2. How to work with chord and scale tone rules: While we are generally familiar with the chord and scale rules, we really do not understand them and how they interact with the CASM settings. There are some styles where a D in a CMaj7 pattern works just fine and others where it does not. And what to do when you really want an F in the pattern?
3. CASM Settings: How do the various transposition settings change the reproduction?
4. Session Styles: How to make them?
5. Is the "Note Mute" in the Ctab practically used? What possibilities are provided by the "Note Mute" functionality?
6. Meaning (and naming) of Bit 2 and Bit 3 in "Chord Mute (Part 1)" in the Ctab.
7. Full meaning of Cntt structures and how they compete with NTT.
(Maybe the Cntt section has been introduced for compatibility reasons? I. e. older PSRs may be programmed in such a manner that they did not allow to increase the set of NTT values in the Ctab section? If so, then one would expect that on the newer instruments the Cntt value would always override the value in the Ctab section, which seems to be the case.)
8. How many Cntt structures are commonly used compared to the number of Ctab structures?
9. Some more details about the note transposition table described in 5.2.6. would be interesting.
10. What NTT settings are practically used?
11. Intros can be setup so that they follow the chord changes of the left hand, and so that they autonomously change the chords. How is this programmed in the style? With NTT = Bypass?
12. If Intro and Ending sections autonomously play all chord changes, then are there any notes allowed in these parts? Not only the restricted set (transposed to the current played chord) listed in Table 28?
13. How to prepare a style so that it can be used in XGWorks?

A. Decimal-Hexadecimal Conversion Table

Dec	Hex	Dec	Hex	Dec	Hex	Dec	Hex	Dec	Hex	Dec	Hex	Dec	Hex	Dec	Hex
0	00	32	20	64	40	96	60	128	80	160	A0	192	C0	224	E0
1	01	33	21	65	41	97	61	129	81	161	A1	193	C1	225	E1
